CprE 210 Lec 15 1 • Multiplexers are circuits which select one of many inputs • In here, we assume that we have one-bit inputs (in general, each input may have more than one bit) • Suppose we have eight inputs: I0, I1, I2, I3, I4, I5, I6, I7 • We want one of them to be output based on selection signals • 3 bits of selection signals to decide which input goes to output

The schematic diagram shows an audio stage with a common-collector circuit. This does not damp the tuned circuit, but instead actually increases its response. This yields good sensitivity and selectivity. Due to the low supply voltage, the subsequent audio amplifier needs three transistor stages. The volume is adjusted using the potentiometer.

Power supply to the circuit is derived from a step-down transformer T1 (230V AC primary to 0-9V, 300mA secondary), rectified by a full-wave rectifier comprising diodes D1 through D4 and filtered by capacitor C1. Assemble the circuit on a general-purpose PCB with adequate spacing between the components.
