Heat can travel from one place to another in three ways: Conduction, Convection and Radiation. Both conduction and convection require matter to transfer heat. If there is a temperature difference between two systems heat will always find a way to transfer from the higher to lower system.

How is heat transferred? Conduction -- Convection -- Radiation

In 1988 and 1989, his peers named two dimensionless groups Bejan number (Be), in two different fields: for the pressure difference group, in heat transfer by forced convection, and for the dimensionless ratio of fluid friction irreversibility divided by heat transfer irreversibility, in thermodynamics.

Adrian Bejan - Wikipedia

Show that the heat transfer rate between the two walls is the same as if the fluid were at rest. Calculate the heat flux exchanged by the two walls. Assume that the fluid viscosity varies linearly as a function of temperature in the range defined by the walls' temperature.
