In electronics and electrical engineering, a fuse is an electrical safety device that operates to provide overcurrent protection of an electrical circuit. Its essential component is a metal wire or strip that melts when too much current flows through it, thereby interrupting the current. It is a sacrificial device; once a fuse has operated it is an open circuit, and it must be replaced or ...

In physics and electrical engineering, a conductor is an object or type of material that allows the flow of charge (electrical current) in one or more directions. Materials made of metal are common electrical conductors. Electrical current is generated by the flow of negatively charged electrons, positively charged holes, and positive or negative ions in some cases.

Electrical conductivity is used to measure the salinity of a soil. Old units of electrical conductivity were mmho/cm; the USDA Handbook No. 60, edited by L.A. Richards (1954), still in use for standard measurements of saline soils, uses the old unit of mmho/cm. We need to know how to convert mmho/cm into SI units. The SI unit for conductance is the Siemens.
