A petrol engine (known as a gasoline engine in American English) is an internal combustion engine with spark-ignition, designed to run on petrol and similar volatile fuels.. In most petrol engines, the fuel and air are usually mixed after compression (although some modern petrol engines now use cylinder-direct petrol injection).

Both diesel engines and gasoline engines convert fuel into energy through a series of small explosions or combustions. The major difference between diesel and gasoline is the way these explosions happen. In a gasoline engine, fuel is mixed with air, compressed by pistons and ignited by sparks from spark plugs.

How Gasoline Engine Works

Run engine for 2 minutes to circulate stabilizer through the fuel system; Store lawn mower or equipment in clean, dry place for up to 24 months; If gasoline in the small engine has not been treated with a fuel stabilizer, it must be drained into an approved container. Run the engine until it stops from lack of fuel.

With gas engines but especially with diesel engines, regular oil changes are a must. Diesel fuel is not as refined as gasoline and the oil will get dirtier than a gasoline engine. Replace air and fuel filters once a year. If you live in a cold climate, you will need to switch to a winter blend fuel to prevent fuel gelling.

The principle behind any reciprocating internal combustion engine: If you put a tiny amount of high-energy-density fuel (like gasoline) in a small, enclosed space and ignite it, an incredible amount of energy is released in the form of expanding gas. You can use that energy for interesting purposes.

Gasoline engine - Fuel: Gasoline was originally considered dangerous and was discarded and destroyed at early refineries, which were manufacturing kerosene for lamps. As the gasoline engine developed, gasoline and the engine were harmonized to attain the best possible matching of characteristics. The most important properties of gasoline are its volatility and antiknock quality.
