Answer Wiki. In a normal solution, the solvent is greater than the solute for it to dissolve, hence a supersaturated solution is different. The most common example is the supersaturated Sodium Acetate. A supersaturated solution of sodium acetate looks very cool when you drop a sodium acetate crystal into its supersaturated solution and...

A solution contains a solvent, which is the substance that dissolves the solute (such as water dissolving a salt). In a normal solution, the solvent is greater than the solute for it to dissolve, hence a supersaturated solution is different. The most common example is the supersaturated Sodium Acetate. A hand warmer is one example.

May 24, 2014. A supersaturated solution contains more solute at a given temperature than is needed to form a saturated solution. Increased temperature usually increases the solubility of solids in liquids. For example, the solubility of glucose at 25 °C is 91 g/100 mL of water. The solubility at 50 °C is 244 g/100 mL of water.
