Convective Heat Transfer. Heat energy transferred between a surface and a moving fluid with different temperatures - is known as convection. In reality this is a combination of diffusion and bulk motion of molecules. Near the surface the fluid velocity is low, and diffusion dominates. At distance from the surface, bulk motion increases the influence and dominates.

The fluid can be a gas or a liquid; both have applications in aerospace technology. In convection heat transfer, the heat is moved through bulk transfer of a non-uniform temperature fluid. The third

process is radiation or transmission of energy through space without the necessary presence of matter.

R.W. Serth, in Process Heat Transfer, 2007. 9.3.3 Convective effects in tube bundles. Heat-transfer coefficients for boiling on tube bundles are generally higher than for boiling on single tubes under the same conditions. The enhancement in heat-transfer rate is due to the convective circulation that is set up within and around the tube bundle.

Heat transfer is a discipline of thermal engineering that concerns the generation, use, conversion, and exchange of thermal energy (heat) between physical systems. Heat transfer is classified into various mechanisms, such as thermal conduction, thermal convection, thermal radiation, and transfer of energy by phase changes.

Heat transfer - Wikipedia

In a heat transfer process, this temperature difference will vary either with position or with time. The general heat transfer equation was thus developed as an extension to Newton's law of cooling, where the mean temperature difference is used to establish the heat transfer area required for a given heat duty.
