Exponential Fourier Series Examples And

This version of the Fourier series is called the exponential Fourier series and is generally easier to obtain because only one set of coefficients needs to be evaluated. Example of Rectangular Wave. As an example, let us find the exponential series for the following rectangular wave, given by

Exponential Fourier Series with Solved Example ...

Since the coefficients c_n of the Exponential Fourier Series are related to the Trigonometric Series by
$$\{c_0\} = \{a_0\} \text{ \cr } \{c_n\} = \left\{ \frac{\{a_n\}}{2} - j \frac{\{b_n\}}{2} \right\} \text{ for } n \neq 0$$

$$\text{ \cr } \{c_{-n}\} = c_n^* \text{ \cr }$$
 (assuming $x_T(t)$ is real) we can use the symmetry properties of the Trigonometric Series to find a_n and b_n and hence c_n .

Exponential Fourier Series. adding these two equations together and dividing by 2 yields $\cos(\theta) = (e^{j\theta} + e^{-j\theta})/2$ while subtracting them and dividing by $2j$ yields $\sin(\theta) = (e^{j\theta} - e^{-j\theta})/2j$. Thus complex exponentials can be expressed as trig functions while trig functions can be expressed as complex exponentials.

Example 1: a simple Fourier series. $s(x) = \cos nx$ for $0 \leq x < \pi$. $s(x) = \sin nx$ for $\pi \leq x < 2\pi$. It can be proven that Fourier series converges to $s(x)$ at every point x where s is differentiable, and therefore: $s(x) = \frac{1}{2} [s(x^+) + s(x^-)]$ (Eq.1) When $x = \pi$, the Fourier series converges to 0, which is the half-sum...

The most straightforward way to convert a real Fourier series to a complex Fourier series is to use formulas 3 and 4. First each sine or cosine can be split into two exponential terms, and then the matching terms must be collected together. The following examples show how to do this with a real Fourier series (often called a trigonometric
