Norton's theorem says that a linear two-terminal electric circuit may be exchanged with a Norton equivalent circuit consisting of a current source, I_N , in parallel with a Norton resistor R_N . Where I_N is the short-circuit current through the terminals load resistor and R_N is equivalent resistance at the terminals when all the independent sources are turned off.

Mesh current Analysis provide a procedure for electric circuit analysis using mesh current as the circuit variable. The mesh analysis makes use of Kirchhoff's Voltage Law as a basic key to analyze the circuit. In contrast to Nodal analysis, it uses loop current as a variable rather than element current, so it reduces the number of equations and complexity.
