### Engine Cooling Fan System

A liquid-based engine cooling system (force circulation) is the most common for Horton fan drive and fan applications and that system consists of a: Radiator; Water pump; Thermostat; Fan drive (or fan clutch) Fan; Radiator. While there are different types of radiators, a common type is called a gilled tube radiator.

A water-cooled cooling system. Usually the pump sends coolant up through the engine and down through the radiator, taking advantage of the fact that hot water expands, becomes lighter and rises above cool water when heated. Its natural tendency is to flow upwards, and the pump assists circulation.

Cooling fan. Like the thermostat, the cooling fan has to be controlled so that it allows the engine to maintain a constant temperature. Front-wheel drive cars have electric fans because the engine is usually mounted transversely, meaning the output of the engine points toward the side of the car.

The Flexxaire Fan System is an elegant refinement of the variable pitch fan. Rather than focusing on varying the pitch of the blades, Flexxaire has created a variable pitch engine cooling fan system that understands when and how the pitch should change to maximize your engine's performance.

### Variable Pitch Reversible Fan System | Flexxaire

A cooling system works by sending a liquid coolant through passages in the engine block and heads. As the coolant flows through these passages, it picks up heat from the engine. The heated fluid then makes its way through a rubber hose to the radiator in the front of the car.

Radiator (engine cooling) Engine coolant is usually water-based, but may also be oil. It is common to employ a water pump to force the engine coolant to circulate, and also for an axial fan to force air through the radiator.

### Radiator (engine cooling) - Wikipedia

Featured Brands. The cooling system transfers heat from the engine to the coolant, which then dissipates it to the surrounding air in the radiator. High performance engines create more heat than the stock cooling system can handle, so you need components with increased capacity and heat transfer capability.

The engine in your car runs best at a fairly high temperature. When the engine is cold, components wear out faster, and the engine is less efficient and emits more pollution. So another important job of the cooling system is to allow the engine to heat up as quickly as possible, and then to keep the engine at a constant temperature.
