A dynamometer or "dyno" for short, is a device for measuring force, torque, or power. For example, the power produced by an engine, motor or other rotating prime mover can be calculated by simultaneously measuring torque and rotational speed (RPM). In addition to being used to determine the torque or power characteristics of a machine under test, dynamometers are employed in a number of other roles.

Testing. Dynamometer testing is basically broken into three types: An acceleration or sweep test is when the engine is allowed to accelerate from a specified lower "starting" rpm to a specified upper "ending" rpm. The same concept can be applied to a deceleration test when the test starts at a high rpm and ends at a lower speed.
