Classical Electrodynamics is one of the most beautiful things in the world. Four simple vector equations (or one tensor equation and an associated dual) describe the unified electromagnetic field and more or less directly imply the theory of relativity. The discovery and proof that light is an

8 classical electrodynamics you can take away the summation sign (\sum) without changing the meaning of the expression. Therefore, you can write $A_B = A_i B_i$. (1.2) Here the repeated index i is

called the “dummy index” (\tilde{N}), and a dummy index is implicitly summed over. To generalize this convection to more general cases, we need to follow ...

Jackson's book needs no introduction. Because it covers just about everything in classical electrodynamics with unparalleled mathematical rigor, it's been the standard graduate textbook for electromagnetics. In person, the book is actually quite thin for being the bible of electromagnetics.

I agree to some extent, but most theorists only study a few solutions of the Schrödinger equation (particle in a box, potential well, potential barrier, harmonic oscillator, hydrogen atom, and perhaps a few others), and they're still forced to study Jackson, which is 800+ pages about how to solve boundary value problems in electrodynamics.
