Engine tuning is the adjustment or modification of the internal combustion engine or Engine Control Unit (ECU) to yield optimal performance and increase the engine's power output, economy, or durability. These goals may be mutually exclusive; an engine may be de-tuned with respect to output power in exchange for better economy or longer engine life due to lessened stress on engine components.

Datalogging of the engine sensor data during a wide open throttle run reveals the actual air consumption. This air consumption is used by the PCM to calculate engine load. Notice how this naturally aspirated engine develops approximately 86% engine load at WOT. An early form of fuel injection is central port injection.

The Basics of Engine Tuning i.e. ECU Remapping. An ECU contains the instructions for the fuelling, camshaft position and ignition timing systems to operate based on engine rpm and load. These instructions are known as 'THE MAPS'. Changing these instructions requires us to change the maps. Hence the word - ECU remapping.
