Heat Pump Prep Test. You are starting-up a split system heat pump for the first time. The outdoor ambient temperature is 60 F. You check the temperature split across the indoor coil in the heat mode and find it is 380F. You switch to cooling mode and determine a temperature split of 29F. The most likely corrective action (relative to airflow) is;

The Y Balance Test™ (YBT) is a simple, yet reliable, test used to measure dynamic balance (1). It was developed to standardise the modified Star Excursion Balance Test (mSEBT), improve its practicality, and make it commercially available (1). Since then, the YBT has gone on to become an extremely popular test due to its simplicity and reliability.

Heat Balance Equation. On the left-hand side of the equation, and are positive when they represent gains and negative when they represent losses of heat. When both sides of a heat balance equation are positive, the equation is a statement of how the total supply of heat available from sources is divided between individual sinks.

Heat balance. An application of the first law of thermodynamics to a process in which any work terms are negligible. For a closed system, one that always consists of the same material, the first law is $Q + W = \Delta E$, where Q is the heat supplied to the system, W is the work done on the system, and ΔE is the increase in energy of the material forming the system.

Mechanisms of Heat Exchange. Conduction is the transfer of heat by two objects that are in direct contact with one another. It occurs when the skin comes in contact with a cold or warm object. For example, when holding a glass of ice water, the heat from your skin will warm the glass and in turn melt the ice.
