Rf values are calculated by looking at the distance each component travels on the chromatography paper compared to the distance traveled by the solvent front. This ratio will be different for each component due to its unique chemical properties. When measuring the distance the component traveled, you should measure from the origin (where the middle of the spot originally was) and then to the ...

Since this answer is getting plenty of hits: the glmnetUtils package provides a formula-based interface to glmnet, like that used for most R modelling functions. It includes methods for glmnet and cv.glmnet, as well as a new cva.glmnet function to do crossvalidation for both alpha and lambda.. The above would become. cv.glmnet(X2 ~ ., data=t2[-1], family="multinomial")
