Specific Heat Capacity of Ethylene Glycol based Water Solutions. The density of ethylene glycol is higher than water - check the specific gravity (SG) table above, so the net impact on the heat transport capacity is reduced. Example - the specific heat of an ethylene glycol water solution 50% / 50% is 0.815 at 80 °F (26.7 °C).

Hydrate inhibition. Because of its high boiling point and affinity for water, ethylene glycol is a useful desiccant. Ethylene glycol is widely used to inhibit the formation of natural gas clathrates (hydrates) in long multiphase pipelines that convey natural gas from remote gas fields to a gas processing facility.

Different engine coolants. Therefore, it's always recommended to add ethylene glycol (i.e., antifreeze) to water in a 1:1 ratio, and then pour this mixture into your car's radiator. This solution helps the car engine perform more efficiently, and ensures that your car doesn't stop working in the middle of a cold desert.

You may remember that about 93% of most coolant is ethylene glycol, another few percentage points are water and/or a solvent to keep rust/corrosion inhibitors in solution and the remainder are those inhibitors. The inhibitors make a huge difference, and they're what all the arguments are about. Didn't we talk about all these coolants last year?

This is the colligative property called freezing point depression. The more solute dissolved, the greater the effect. An equation has been developed for this behavior. It is: $\Delta t = i K_f m$. Δt is the temperature change from the pure solvent's freezing point to the freezing point of the solution.
